

# CASCADE ASPIRATOR/ CYCLONE ASSEMBLY

## DUST IS THE ENEMY!

### Seed quality is a precondition for coating quality

The most important factor for coating quality is seed cleaning. A measurable waste amount of product is the effect of dust and small particles in the seed lot. Dust/particles found within the treater reduce seed flow, which results in an unhomogeneous distribution of product on the seed.

Treating dust along with the seed reduces the amount of active ingredient applied on the seed and causes buildup in the treater, making clean out more difficult. Buildup of treated dust often breaks off, ending up in the seed bag, which in turn causes clogging issues in the seed sowing machine.

### PARTICLES WITHIN

- Untreated seed: often not recognizable
- Treated seed: intensively coloured

### EFFECT OF DUST ON LOSS OF ACTIVE INGREDIENT
